## Bird recognition in the city of Peacetopia (case study)

100%

## 1. Problem Statement

1 / 1 point

This example is adapted from a real production application, but with details disguised to protect confidentiality.

You are a famous researcher in the City of Peacetopia. The people of Peacetopia have a common characteristic: they are afraid of birds. To save them, you have **to build an algorithm that will detect any bird flying over Peacetopia** and alert the population.

The City Council gives you a dataset of 10,000,000 images of the sky above Peacetopia, taken from the city's security cameras. They are labelled:

- y = 0: There is no bird on the image
- y = 1: There is a bird on the image

Your goal is to build an algorithm able to classify new images taken by security cameras from Peacetopia.

There are a lot of decisions to make:

- What is the evaluation metric?
- How do you structure your data into train/dev/test sets?

## **Metric of success**

The City Council tells you that they want an algorithm that

- 1. Has high accuracy
- $2. \ \mbox{Runs}$  quickly and takes only a short time to classify a new image.
- 3. Can fit in a small amount of memory, so that it can run in a small processor that the city will attach to many different security cameras.

Note: Having three evaluation metrics makes it harder for you to quickly choose between two different algorithms, and will slow down the speed with which your team can iterate. True/False?

○ False

✓ Correct

2. After further discussions, the city narrows down its criteria to:

1 / 1 point

- "We need an algorithm that can let us know a bird is flying over Peacetopia as accurately as possible."
- $\bullet~$  "We want the trained model to take no more than 10sec to classify a new image."
- "We want the model to fit in 10MB of memory."

If you had the three following models, which one would you choose?

		D. matter	Mamarielei	
	Test Accuracy 97%	Runtime 1 sec	Memory size 3MB	
	3770	1 266	DIVID	
C	Test Accuracy	Runtime	Memory size	
	99%	13 sec	9MB	
)	Took Assumes	Dunting	Managarina	
	Test Accuracy 97%	Runtime 3 sec	Memory size 2MB	
	2/70	5 sec	ZIVID	
•	Test Accuracy	Runtime	Memory size	
	98%	9 sec	9MB	
_	Correct			
·	Correct! As so		ntime is less than 10 ure the runtime is <	) seconds you're good. So, you may simply maximize the test 10sec.
Basec	d on the city's re	auests, which	of the following wo	ould you say is true?
A	ccuracy is an op	otimizing metr	ric; running time an	d memory size are a satisficing metrics.
) A	accuracy is a sati	sficing metric	; running time and	memory size are an optimizing metric.
) A	ccuracy, runnin	g time and me	emory size are all o	otimizing metrics because you want to do well on all three.
) A	ccuracy, runnin	g time and me	emory size are all s	atisficing metrics because you have to do sufficiently well on all

A learning algorithm's performance can be better than human-level performance can be better than human-level performance.	erformance but it can never be better than	
A learning algorithm's performance can never be better than human-le Bayes error.	evel performance but it can be better than	
A learning algorithm's performance can never be better than human-le	evel performance nor better than Baves error.	
A learning algorithm's performance can be better than human-level pe		
✓ Correct		
You find that a team of ornithologists debating and discussing an image ge define that as "human-level performance." After working further on your al		/ 1 point
Human-level performance	0.1%	
Training set error	2.0%	
Dev set error	2.1%	

Based on the evidence you have, which two of the following four options seem the most promising to try? (Check two options.)

	✓ Train a bigger model to try to d	o better on the training set.	
	✓ Correct		
(	Get a bigger training set to red	uce variance.	
	Try decreasing regularization.		
	✓ Correct		
(	Try increasing regularization.		
11. Y	ou also evaluate your model on th	e test set, and find the following:	1 / 1 point
	Human-level performance	0.1%	
	Training set error	2.0%	
	Dev set error	2.1%	
	Test set error	7.0%	
١	What does this mean? (Check the tw	vo best options.)	
	✓ You have overfit to the dev set.		
	✓ Correct		
	✓ You should try to get a bigger of	lev set.	
	✓ Correct		
[	You have underfit to the dev se	et.	
	You should get a bigger test se		
12. <i>A</i>	After working on this project for a y Human-level performance	0.10%	1/1 point
	Training set error	0.05%	
	Dev set error	0.05%	
١	What can you conclude? (Check all 1	hat apply.)	
	✓ If the test set is big enough for	the 0.05% error estimate to be accurate, this implies Bayes error is $\leq 0.05$	
	✓ Correct		
	It is now harder to measure av	oidable bias, thus progress will be slower going forward.	
	✓ Correct		
[		ss to make, you should quickly be able to close the remaining gap to 0%	
[	This is a statistical anomaly (or human-level performance.	must be the result of statistical noise) since it should not be possible to surp	Dass
k H	ooth deliver systems with about the However, when Peacetopia tries ou	ne of your competitors to build a system as well. Your system and your comp e same running time and memory size. However, your system has higher ac t your and your competitor's systems, they conclude they actually like your e even though you have higher overall accuracy, you have more false negati he air). What should you do?	curacy!
(	Look at all the models you've d negative error rate.	eveloped during the development process and find the one with the lowest	false
(	Ask your team to take into acco	ount both accuracy and false negative rate during development.	
(	Rethink the appropriate metric	for this task, and ask your team to tune to the new metric.	
(	Pick false negative rate as the r	new metric, and use this new metric to drive all further development.	
	✓ Correct		

14. You've handily beaten your competitor, and your system is now deployed in Peacetopia and is protecting the citizens from 1/1 point  $birds! \ But \ over the \ last \ few \ months, \ a \ new \ species \ of \ bird \ has \ been \ slowly \ migrating \ into \ the \ area, so \ the \ performance \ of \ birds \ has \ been \ slowly \ migrating \ into \ the \ area, so \ the \ performance \ of \ birds \ has \ been \ slowly \ migrating \ into \ the \ area, so \ the \ performance \ of \ birds \ has \ been \ slowly \ migrating \ into \ the \ area, so \ the \ performance \ of \ has \ been \ slowly \ migrating \ into \ the \ area, so \ the \ performance \ of \ has \ been \ slowly \ migrating \ into \ the \ area, so \ the \ performance \ of \ has \ been \ slowly \ migrating \ into \ the \ area, so \ the \ performance \ of \ has \ been \ slowly \ migrating \ into \ the \ area, so \ the \ performance \ of \ has \ been \ slowly \ migrating \ into \ the \ area, so \ the \ performance \ of \ has \ been \ slowly \ migrating \ into \ the \ area, so \ the \ performance \ of \ has \$ your system slowly degrades because your data is being tested on a new type of data.

You have only 1,000 images of the new species of bird. The city expects a better system from you within the next 3 months. Which of these should you do first?

<ul><li>•</li></ul>	Use the data you have to define a new evaluation metric (using a new dev/test set) taking into account the new species, and use that to drive further progress for your team.
$\bigcirc$	Put the 1,000 images into the training set so as to try to do better on these birds.
$\bigcirc$	Try data augmentation/data synthesis to get more images of the new type of bird.

Add the 1,000 images into your dataset and reshuffle into a new train/dev/test split.

15. The City Council thinks that having more Cats in the city would help scare off birds. They are so happy with your work on 1/1 point the Bird detector that they also hire you to build a Cat detector. (Wow Cat detectors are just incredibly useful aren't they.) Because of years of working on Cat detectors, you have such a huge dataset of 100,000,000 cat images that training on this data takes about two weeks. Which of the statements do you agree with? (Check all that agree.)

☑ If 100,000,000 examples is enough to build a good enough Cat detector, you might be better of training with just 10,000,000 examples to gain a  $\approx$  10x improvement in how quickly you can run experiments, even if each model performs a bit worse because it's trained on less data.

✓ Correct

Having built a good Bird detector, you should be able to take the same model and hyperparameters and just apply it to the Cat dataset, so there is no need to iterate.

Needing two weeks to train will limit the speed at which you can iterate.

✓ Correct

Buying faster computers could speed up your teams' iteration speed and thus your team's productivity.

✓ Correct
